Dear Selection Committee,

It is my greatest pleasure to apply to [College Name] as studying there encourage life-long learners to development their professional skills through academic problem-solving as well as real-world applications. I have reviewed the programs that your college suggest for students and was glad to admit that traditional courses, such as English and History are essential part of the curriculum, and every subject includes Technology that is really necessary for a college degree, as well as future profession.

As far as I remember myself, I have always wanted to become an engineer. I have chosen this profession because it provides many solutions that are not related only to the infrastructure problems people have, but what is more, to the reconstruction of public services. It is my belief that engineers should contain the needs for science and engineering in the political field, and accept it as fundamental to the long-term well-being effect of any economy or society. As the duty of engineers is to safeguard human life and health, economic interests and property, the public comfort and the environment, I want to be a useful person and a specialist for both the society and my native country. After searching the number of engineering degrees that are awarded in the American universities, I have noticed that it is lower when comparing it with European countries. This condition is also an important driving force for me to become a successful engineer.

Beginning from my fist year studying at elementary school, I have always had a great desire to get new knowledge as well as learn new subject. Having free time I tried to spend it with encyclopedias by investigating new spheres of science instead of wasting it on computer games or social networking. Such activities contributed developing problem-solving skills and analytical thinking. There were not any subjects that I did not like. Moreover, I was good at Mathematics and IT technologies that are required skills in the profession of engineering. The teacher of Math that taught in my class made the focus on the way this subject is used in real situations in the world. I also conducted simulations and used different calculus equipment. Participating in various school projects claimed effective communication with the participants I worked with. So I was well motivated, always polite and cooperated with other students. In addition, being involved in multiple projects, I had to manage

my time efficiently. I am convinced that this ability will be really useful in my higher education as well future career.

Having rich experience in the field of project work I can share my theoretical and practical skills with other learners and suggest interesting ideas for new robotics programs. They will further allow students use their technical experience, critical thinking and constructive skills in the practice. This proposal will provide my active participation in your new projects as well. From the above information it is clearly seen that my leadership roles will help me to succeed during studying in your [College Name]. Besides, I want to apply all my personal experience, theoretical and practical skills in your educational program and obtain new professional knowledge that will be useful in my future career.

Thank you for your time and consideration.

It would be a great honor to me to enter to your [College Name] and pursue my career goals to get the qualified education at your establishment.

Sincerely yours,
